While the taste of a ripe, homegrown peach, apricot, nectarine, or aprium is incredible in the heat of the summer, these stone fruits can be challenging to grow in Western Washington. They do best in areas with hot, dry climates. Wet springs reduce pollination and late frost can cause bloom damage...both of which result in a lack of fruit set. In addition these fruit trees are susceptible to Peach Leaf Curl, a fungal infection which results in discoloration, contorted leaves, and defoliation. If left untreated this disease may result in tree death within 3 years. Selecting resistant cultivars greatly combats this disease, however, recently even resistant cultivars have been severley impacted. Growers must be prepared to develop a spray regiment from early winter into spring using a copper based fungicide.

Pollination Notes:

While many varieties of Peaches, Apricots, Nectarines, and Apriums are self-fertile, a pollinator is suggested for a better fruit set.

Directions for use of chart:

1. From the left-hand column select a cultivar you are interested in growing.
2. Check across the chart. The unmarked boxes will be a reliable pollinizer for the chosen cultivar.

*** These varieties require a pollinator**
